

# Resolve IT Problems Faster with Full-Stack Context and Cross-Domain Correlation

Combine the power of AppDynamics' continuous application performance monitoring with CloudFabrix domain-agnostic AIOps to add full-stack asset context and cross-domain correlation to help resolve IT problems faster.

Action

## The Context

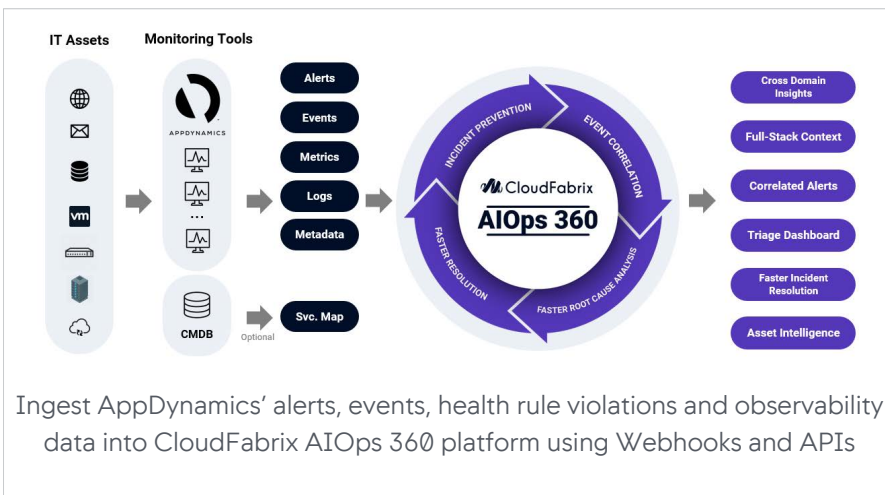

Modern IT environments are becoming complex today with hybrid monitoring tool implementations, making it difficult for IT personnel to address traditional/legacy tool's event data in a concerted manner with intelligent alert/event data from modern APM tools, like AppDynamics

## AppDynamics + CloudFabrix Integration Value

AppDynamics gives you the power to ensure flawless customer experiences driven by continuous application monitoring, while CloudFabrix brings you the power of domain-agnostic AIOps enabling algorithmic decision in hybrid monitoring environments. With AppDynamics and CloudFabrix integration, customers can automatically enrich and correlate 3rd party traditional/legacy event feeds with AppDynamics' intelligent alerts and accelerate incident resolution with additional insights from correlated cross-domain data sources, resulting in increased IT productivity and fewer escalations.

### Unify IT Data to enable Algorithmic IT Operations

- **Cross-Domain Insights** - Combine AppDynamics observability data with full-stack data to glean additional insights.
- **Actionable Incidents** - Correlate AppDynamics events with events from other tools to add context and increase actionability of incidents
- **Faster Resolutions** - Triage, diagnose, collaborate and resolve incidents faster with unified operational insights and tools featured in Incident Room

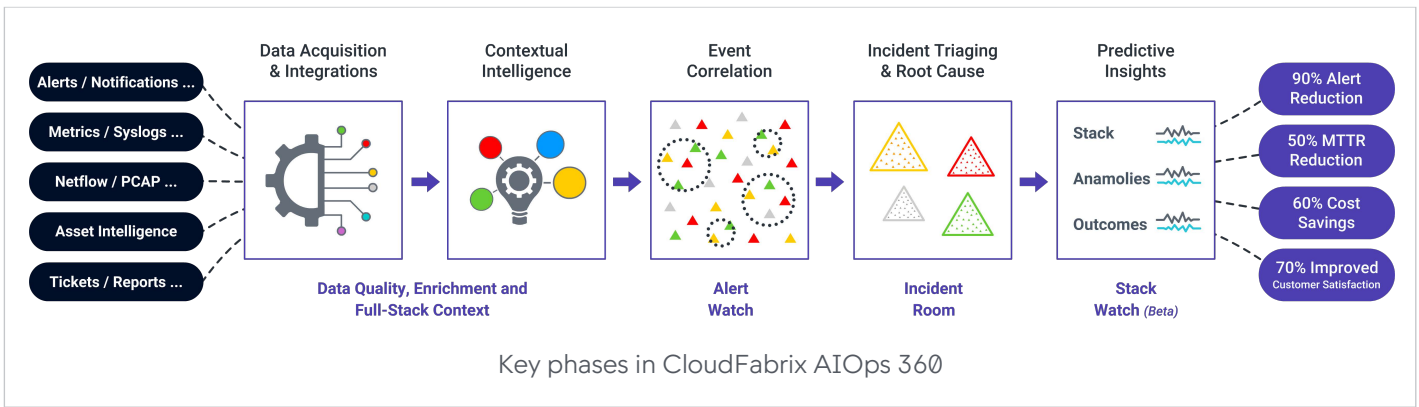

# CloudFabrix AIOps 360

CloudFabrix AIOps 360 is a domain-agnostic AIOps platform enabling algorithmic IT operations by operating on hybrid data sources and monitoring feeds. A unique aspect of AIOps 360 is its automated data quality analysis and qualification of suitable data sources for AIOps implementation. Another salient feature is its ability to feed rich asset context to AIOps using its built-in asset discovery, dynamic asset resolution and full-stack dependency mapping, all of which will enable automated data enrichment. AIOps 360 then correlates alerts and events from several operational data sources to create more context-rich and actionable incidents that can be analyzed in Incident Room module for swift resolution

**"A true AIOps solution relieves a lot of burden off the staff for having to piece together all the data sources they are not familiar with.**

**You are just a consumer of results of looking at the data"**

-Rich Lane, Sr. Analyst, Forrester

Incident Room provides concerted view of metrics from heterogeneous monitoring sources with single pane triage dashboard, insights for root cause inference, diagnostic tools, and in-place collaboration console to communicate with other IT teams. As implementation matures, customers can get early signals for incidents leveraging predictive insights.

## Getting Started is Easy

Integration between AppDynamics and CloudFabrix AIOps 360 platform can be setup easily with webhooks, for ingesting alert/event data and with client API keys for ingesting observability data. Both solutions support on-premise and cloud deployments, including a fully-managed SaaS offering.
